

Project Odyssey — Presentation Script

1. The Problem We're Solving

Travel planning today is broken — and fragmented.

You open Google Maps to discover places, copy them into Notes, manually draft a day-by-day itinerary in Notion, share it over WhatsApp with friends, argue about timings, lose track of who's visiting what, and forget half the places you actually wanted to see.

There's no single platform that takes you from *"I want to travel"* all the way to *"I'm standing at the destination, and I know what's next."*

Project Odyssey solves that — end to end.

2. What We Built & Key Features

Project Odyssey is a full-stack AI-powered travel companion — not just a planner, but a complete travel ecosystem.

AI Itinerary Planner

The core of the platform. You search and pin places into your **Collections**, set your trip duration, and hit Generate. Our AI — powered by Gemini — produces **3 distinct itinerary options** simultaneously: Minimalist, Maximum Adventure, and Balanced. Each has a full day-by-day schedule with times, visit durations, entry costs in the correct local currency (BDT, THB, INR, etc.), and reasoning for each stop. You pick one, it gets saved to your **interactive drag-and-drop timeline**.

Trip Timeline & Management

Trips have a full status lifecycle: Planning → Active → Completed. The timeline is interactive — drag items between days, add meal breaks, edit visit durations. Cost information is shown per item directly in the timeline.

Group Trip Planning + Real-Time Chat

Multiple users can collaborate on a single trip. One person creates a group, invites others, and the group shares a live itinerary. A built-in **group chat** lets everyone coordinate in real time — no WhatsApp needed.

Location Tracking & Smart Notifications

When a trip goes active, the system sets up **geofences** around each planned destination. As you physically arrive at or depart from a place, you get push notifications. The system also warns you about timing and alerts if you're going off-route. You can configure notification frequency and quiet hours.

Social Feed & Reviews

Travelers can post about their trips — think travel blogging. Posts support likes, comments, and saves. When you review a place, you can optionally **auto-share it to the feed in one click** — the review saves to the database and a feed post is created simultaneously. The feed is **smart and personalized** — it surfaces content from people you follow, weighted by relevance.

Notification Center

A bell icon with unread badge. Real-time notifications for likes, comments, follows, trip events, and geofence triggers. Mark individual or all as read, with polling to keep the badge count live.

Gamification — XP, Levels, Streaks, Achievements

Your profile isn't just a profile — it's a **traveler identity**. Every trip completed, place visited, and review written earns XP. XP unlocks levels. The system tracks your **current travel streak** (consecutive days of activity) and **personal best**. A **Travel Efficiency Score** measures how well your actual travel matches your plans. Badges and achievements reward milestones.

Profile & Analytics

Your profile shows your XP bar, level, badges, efficiency score, streak, recent activity, your posts, saved collections, and travel analytics — all live from the database.

Follow System

Follow other travelers. Your feed adapts to who you follow. See follower/following counts and lists on any public profile.

Destination Discovery

Search places from our own curated database or Google Maps. Each place shows ratings, images, reviews, and estimated costs. AI also discovers new places during generation and feeds them back into the database automatically.

3. Live Demo Flow

1. **Login → Profile** — show XP, level, streak, efficiency score (live data)
 2. **Planner** — search “Lalbagh Fort” from DB, pin to Collections, hit Generate → 3 options appear with BDT costs
 3. **Confirm itinerary** → timeline populates with entry costs per stop
 4. **Switch trip in sidebar** → different trip loads instantly
 5. **Feed** — show a travel post with likes/comments, write a review with “share to feed” ticked
 6. **Notifications bell** — show unread count + dropdown
 7. **Groups** — show shared itinerary + group chat
-

4. Value & Practical Applicability

For individual travelers: One platform from discovery to day-of navigation. No more juggling 5 apps.

For groups: Eliminates the coordination chaos of group travel — shared planning, shared chat, one confirmed itinerary everyone can see.

For the travel industry: The platform auto-enriches its own database — every AI-generated itinerary writes pricing data back to places, making future suggestions smarter over time.

Unique Selling Points

- AI generates **3 distinct options** with realistic local pricing — not one generic plan
- Geofencing turns the static itinerary into a **live travel guide** that navigates you in real time
- Gamification makes travel feel **rewarding beyond the trip itself**
- Social layer creates a **community of travelers**, not just isolated users
- Fully **currency-aware** — BDT for Bangladesh, not USD by default

This isn’t a prototype of one feature. It’s a cohesive platform where every module — planning, social, tracking, gamification — connects to the others.
